1.0 INTRODUCTION

1.1 GENERAL INFORMATION

This quarterly monitoring report was prepared for the Skinner Landfill Superfund Site located in West Chester, Butler County, Ohio in accordance with the Operation and Maintenance - Long-Term Performance Plan (O&M-LTP Plan) dated August 2003. The O&M-LTP Plan was prepared to meet the requirements of the Record of Decision (ROD) dated June 4, 1993, the Statement of Work (SOW) dated April 6, 1994, the 100% Final Remedial Design dated June 21, 1996 and the Consent Decree dated April 7, 2001.

The remedial action (RA) post-construction O&M monitoring period began with the third quarter of 2003 and extends for a period of 30 years. This report documents the results of groundwater and surface water monitoring conducted during the fourth quarter of 2006, which is the 14th of 120 quarterly sampling events to be conducted during the 30-year monitoring period.

1.2 SITE LOCATION AND DESCRIPTION

Skinner Landfill is located approximately 15 miles north of Cincinnati, Ohio near West Chester, Butler County, Ohio in Township 3, Section 22, Range 2. The site is located along Cincinnati-Dayton Road, as shown in Figure 1. The site is bordered on the south by the East Fork of Mill Creek, on the north by wooded land, on the east by a Norfolk Southern Railway Company right-of-way, and on the west by a gravel driveway.

The site is located in a highly dissected area that slopes from a till-mantled-bedrock upland to a broad, flat-bottomed valley that is occupied by the main branch of Mill Creek. Elevations on the site range from a high of nearly 800 feet above mean sea level (MSL) in the northeast, to a low of 645 feet above MSL near the confluence of Skinner Creek and East Fork of Mill Creek. Both Skinner Creek and the East Fork of Mill Creek are small, intermittent shallow streams. Both of these streams flow to the southwest from the site toward the main branch of Mill Creek.

In general, the site is underlain by relatively thin glacial drift over inter-bedded shale and limestone of Ordovician age. The composition of the glacial drift ranges from intermixed silt, sand and gravel, to silty sandy clays with a thickness ranging from zero to over forty feet. The sand and gravel deposits comprise the hills and ridges and are encountered near the surface of the central portion of the site. The silts and clays usually occur as lenses in the sands and gravel or directly overlie bedrock.

1.3 SITE HISTORY AND BACKGROUND

The property was originally developed as a sand and gravel mining operation and was subsequently used as a landfill from 1934 to 1990. According to USEPA studies, materials deposited at the site include demolition debris, household refuse and a wide variety of chemical wastes. The waste disposal areas include a now buried former waste lagoon near the center of the site and a landfill. According to USEPA studies, the buried lagoon was used for the disposal of paint wastes, ink wastes, creosote, pesticides, and other chemical wastes. The landfill area, located north and northeast of the buried lagoon, received predominantly demolition and landscaping debris.

In 1976, the Ohio EPA (OEPA) initiated an investigation of the site. In 1982, the site was placed on the National Priority List by the USEPA based on information obtained during a limited investigation of the

site. A Phase II Remedial Investigation was conducted from 1989 to 1991 and involved further investigation of groundwater, surface water, soils and sediments. Both a Baseline Risk Assessment and Feasibility Study (FS) were completed in 1992.

The Phase II Remedial Investigation revealed that the most contaminated media at the site is the soil in the buried waste lagoon. Migration of the landfill constituents has been limited, and the Phase II Remedial Investigation concluded that there had been no off-site migration of landfill constituents via groundwater flow.

In the Record of Decision (ROD), dated June 4, 1993, the USEPA selected a remedy for the site consisting of multi-media capping of the landfill and the buried waste lagoon, and collection and treatment of the groundwater. The ROD also required an investigation to determine the feasibility for soil vapor extraction (SVE) in the granular soil adjacent to the buried lagoon.

The Remedial Design (RD) Investigation performed in 1994 was implemented to collect data required to assess the feasibility of the SVE and to design the multi-media cap and the groundwater extraction/treatment systems. The Remedial Design was submitted to USEPA on June 21. 1996 outlining the cover design and groundwater interception system design. Based on the RD investigation, the installation of an SVE system was determined to be unfeasible.

Construction of a groundwater interception system (GIS) and engineered landfill cover system began in April 2001 and was substantially completed in September 2001. The USEPA conducted the pre-final construction inspection on September 27, 2001, the final construction inspection on March 27, 2003 and the second 5-Year Review on January 22, 2004.

2.0 <u>SAMPLING METHODS</u>

This quarterly monitoring event was conducted in general accordance with the following documents shown with the date of the USEPA-approved final version:

- Operation and Maintenance Long-Term Performance Plan (O&M-LTP Plan) dated August 2003, and
- RA Health and Safety Plan, Final February 2001.

There were no deviations from these work plans.

3.0 RESULTS

3.1 GROUNDWATER LEVELS

The groundwater elevation data obtained from the monitor wells, piezometers and selected gas probes is presented on Table 1 with the corresponding potentiometric surface map provided in Appendix A. The groundwater hydraulic gradient calculated from data collected was 0.08 ft/ft. The average hydraulic gradient documented in the Remedial Action Baseline Monitoring Report, dated March 2005, is calculated to be 0.13 ft/ft.

Viet P

NIN

3.2 GROUNDWATER-WASTE MONITORING

Results of the piezometer groundwater levels used to monitor the groundwater levels relative to bottom of waste are provided on Table 2. Based on measured water levels, groundwater has been lowered below the waste elevation during this monitoring event at piezometer P-12, which is one of the piezometers furthest from Duck Pond. Depth to water measurements could not be recorded from piezometers P-9, P-10 and P-11 due to an obstruction or possible pinching of the well casing. Piezometers P-9 to P-12 will be replaced with new heavy-duty piezometers during the next quarter (January 2007) as a corrective action in accordance with the O&M-LTP Plan.

3.3 GROUNDWATER ANALYTICAL RESULTS

A summary of target compound list (TCL) and target analyte list (TAL) parameter concentrations encountered above the contract required quantitation limit (CRQL) and revised modified trigger level is provided on Table 3. A summary of the laboratory analytical results have been presented on a per well basis in Appendix B to assist in identifying temporal detection patterns. A report of each data set reduction, validation and assessment procedure conducted on an analytical-set basis in accordance with the O&M-LTP Plan quality assurance project plan (QAPP) is included in Appendix C.

In general, target compound list volatiles, semi-volatiles, pesticides and PCBs were not detected in groundwater above the CRQL.

Two of the 24 TAL parameters that have a corresponding trigger level were detected above the CRQL. Concentrations of barium and iron were detected in the groundwater samples collected from monitoring well GW-06R. Iron was also detected in the samples collected from groundwater monitoring wells GW-61, GW-63 and GW-07R. The barium and iron concentrations exceed the CRQL at these locations, but do not exceed the revised modified trigger levels.

Cyanide was detected above trigger levels at GW-07R, GW-58 and GW-64 the previous quarter, but was not detected this quarter.

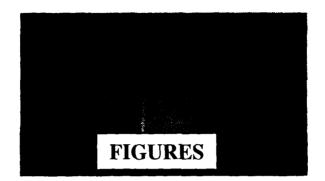

3.4 SURFACE WATER ANALYTICAL RESULTS

Surface water analyzed consisted of three surface water samples collected directly from the East Fork of Mill Creek. A surface water runoff sample for the Site was able to be collected during this quarter from location SWD-3 due to a qualifying rain fall event and flow sufficient to collect the necessary volume of water.

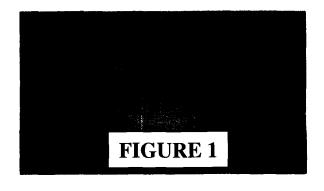

A summary of TCL and TAL parameter concentrations encountered above the CRQL and revised modified trigger level is provided on Table 4. A summary of surface water laboratory analytical results is presented in Appendix B. The summary tables are presented on a sample location basis. The validated laboratory analytical data is provided in Appendix C

Target compound list volatiles, semi-volatiles, pesticides and PCBs were not detected in surface water above the CRQL. None of the 24 TAL parameters, that have a corresponding trigger level, were detected above the CRQL.

- Notes:

 1) All results expressed in micrograms per liter (µg/L).

 2) Standard Inorganic Data Qualifiers have been used.

 3) Yellow shading indicate a detection above the Contract Required Quantitation Limit (CRQL)

 4) Bold red letters with a thick outline indicates a detection above the Trigger Level.

 5) BRL = Below Report Limit; reported data values have a data qualifier of U. J, or UJ

 6) = No Sample Available (Well Dry)

 7) U = Not detected at the listed reporting limit.

 8) B = An estimated value above the method detection limit (MDL) or the instrument detection limit (IDL) but below the CRQL.

 9) UJ = A value less than the CRQL but greater than the MDL.

 10) J = The analyte was positively identified; the associated numerical value is the approximate concentration of analyte in the sample.

 11) R = The sample results are rejected due to deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte can not be verified.

 12) CRQL = Contract Required Quantitation Limit

 13) Samples analyzed for <u>Dissolved</u> Inorganics were field filtered using a 0.45 micron, gravity flow filter.

 14) Detailed summary tables which list report limits and qualified data values for each compound analyzed for by the laboratory as well as qualified laboratory reports are available upon request.

- Notes:

 1) All results expressed in micrograms per liter (µg/L).
 2) Standard Inorganic Data Qualifiers have been used.
 3) Yellow shading indicate a detection above the Contract Required Quantitation Limit (CRQL)
 4) Bold red letters with a thick outline indicates a detection above the Trigger Level.
 5) BRL = Below Report Limit; reported data values have a data qualifier of U. J, or UJ
 6) = No Sample Available (Well Dry)
 7) U = Not detected at the listed reporting limit.
 8) B = An estimated value above the method detection limit (MDL) or the instrument detection limit (IDL) but below the CRQL.
 9) UJ = A value less than the CRQL but greater than the MDL.
 10) J = The analyte was positively identified; the associated numerical value is the approximate concentration of analyte in the sample.
 11) R = The sample results are rejected due to deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte can not be verified.
 12) CRQL = Contract Required Quantitation Limit
 13) Samples analyzed for <u>Dissolved</u> Inorganics were field filtered using a 0.45 micron, gravity flow filter.
 14) Detailed summary tables which list report limits and qualified data values for each compound analyzed for by the laboratory as well as qualified laboratory reports are available upon request.

- Notes:

 1) All results expressed in micrograms per liter (µg/L).

 2) Standard Inorganic Data Qualifiers have been used.

 3) Yellow shading indicate a detection above the Contract Required Quantitation Limit (CRQL)

 4) Bold red letters with a thick outline indicates a detection above the Trigger Level.

 5) BRL = Below Report Limit; reported data values have a data qualifier of U. J, or UJ

 6) No Sample Available (Well Dry)

 7) U = Not detected at the listed reporting limit.

 8) B = An estimated value above the method detection limit (MDL) or the instrument detection limit (IDL) but below the CRQL.

 9) UJ = A value less than the CRQL but greater than the MIDL.

 10) J = The analyte was positively identified; the associated numerical value is the approximate concentration of analyte in the sample.

 11) R = The sample results are rejected due to deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte can not be verified.

 12) CRQL = Contract Required Quantitation Limit

 13) Samples analyzed for Dissolved Inorganics were field filtered using a 0.45 micron, gravity flow filter.

 14) Detailed summary tables which list report limits and qualified data values for each compound analyzed for by the laboratory as well as qualified laboratory reports are available upon request.

- Notes:

 1) All results expressed in micrograms per liter (µg/L).
 2) Standard Inorganic Data Qualifiers have been used.
 3) Yellow shading indicate a detection above the Contract Required Quantitation Limit (CRQL)
 4) Bold red letters with a thick outline indicates a detection above the Trigger Level.
 5) BRL = Below Report Limit; reported data values have a data qualifier of U. J., or UJ
 6) = No Sample Available (Well Dry)
 7) U = Not detected at the listed reporting limit.
 8) B = An estimated value above the method detection limit (MDL) or the instrument detection limit (IDL) but below the CRQL.
 9) UJ = A value less than the CRQL but greater than the MDL.
 10) J = The analyte was positively identified; the associated numerical value is the approximate concentration of analyte in the sample.
 11) R = The sample results are rejected due to deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte can not be verified.
 12) CRQL = Contract Required Quantitation Limit
 13) Samples analyzed for <u>Dissolved</u> Inorganics were field filtered using a 0.45 micron, gravity flow filter.
 14) Detailed summary tables which list report limits and qualified data values for each compound analyzed for by the laboratory as well as qualified laboratory reports are available upon request.

Pesticides / PCBs

- Notes:

 1) All results expressed in micrograms per liter (µg/L).
 2) Standard Incrganic Data Qualifiers have been used.
 3) Yellow shading indicate a detection above the Contract Required Quantitation Limit (CRQL)
 4) Bold red letters with a thick outline indicates a detection above the Trigger Level.
 5) BRL = Below Report Limit; reported data values have a data qualifier of U. J. or UJ
 6) = No Sample Available (Well Dry)
 7) U = Not detected at the listed reporting limit.
 8) B = An estimated value above the method detection limit (MDL) or the instrument detection limit (IDL) but below the CRQL.
 9) UJ = A value less than the CRQL but greater than the MDL.
 10) J = The analyte was positively identified; the associated numerical value is the approximate concentration of analyte in the sample.
 11) R = The sample results are rejected due to deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte can not be verified.
 12) CRQL = Contract Required Quantitation Limit
 13) Samples analyzed for <u>Dissolved</u> Inorganics were field filtered using a 0.45 micron, gravity flow filter.
 14) Detailed summary tables which list report limits and qualified data values for each compound analyzed for by the laboratory as well as qualified laboratory reports are available upon request.

- Notes:

 1) All results expressed in micrograms per liter (µg/L).

 2) Standard Inorganic Data Qualifiers have been used.

 3) Yellow shading indicate a detection above the Contract Required Quantitation Limit (CRQL)

 4) Bold red letters with a thick outline indicates a detection above the Trigger Level.

 5) BRL = Below Report Limit; reported data values have a data qualifier of U. J. or UJ

 6) = No Sample Available (Well Dry)

 7) U = Not detected at the listed reporting limit.

 8) B = An estimated value above the method detection limit (MDL) or the instrument detection limit (IDL) but below the CRQL.

 9) UJ = A value less than the CRQL but greater than the MDL.

 10) J = The analyte was positively identified; the associated numerical value is the approximate concentration of analyte in the sample.

 11) R = The sample results are rejected due to deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte can not be verified.

 12) CRQL = Contract Required Quantitation Limit

 13) Samples analyzed for Dissolved Inorganics were field filtered using a .45 micron, gravity flow filter.

 14) Detailed summary tables which list report limits and qualified data values for each compound analyzed for by the laboratory as well as qualified laboratory reports are available upon request.

DATA VALIDATION SUMMARY – SAMPLE DELIVERY GROUP 206112905 INORGANICS

Validation of the inorganics data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November 2006, was conducted by Earth Tech using the National Functional Guidelines for Inorganic Data Review, (US EPA, February, 1994), as appropriate. The results were reported by GCAL under Sample Delivery Group (SDG) 206112905.

INTRODUCTION

Analyses of metals were performed according to Contract Laboratory Program (CLP)-Inorganic Analysis Multi-media Multi-concentration ILM04.1 Statement of Work (SOW). Results of the sample analyses are reported by the laboratory as either qualified or unqualified. Unqualified results mean that the reported values maybe used without reservation. The laboratory to denote specific information regarding the analytical results uses various qualifier codes.

The data validation process is intended to evaluate the data on a technical basis. The data package also was subjected to an internal laboratory quality review prior to submission to Earth Tech for data validation.

During the validation process, laboratory-qualified and unqualified data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data user.

Final results are therefore, either qualified or unqualified. Validator-qualified results are annotated with the following codes in accordance with the Functional Guidelines:

- U The constituent was analyzed for, but was not detected above the level of the associated analytical reporting limit. The associated value is either the sample quantitation limit or the sample detection limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Details of the inorganics data validation findings and conclusions are provided in the following sections of this report:

- 1. Holding Times
- 2. Calibration

- A. Initial Calibration (IC)
- B. Continuing Calibration (CC)
- 3. Blanks
- 4. Inductively Coupled Plasma (ICP) Interference Check Sample
- 5. Laboratory Control Sample (LCS)
- 6. Duplicate Analysis
- 7. Spike Sample Analysis
- 8. ICP Serial Dilution
- 9. System Performance
- 10. Documentation
- 11. Overall Assessment

1. HOLDING TIMES

All samples for inorganics analyses were analyzed within the 180-day holding time for preserved aqueous samples. Mercury analyses were conducted within the 28-day holding time for aqueous samples undergoing CLP protocol. Cyanide analyses were conducted within the 14-day holding time. The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C .

2. CALIBRATION

A. Initial Calibration

The percent recoveries for the Initial Calibration Verification (ICV) standard were within Quality Control (QC) limits for all constituents.

B. Continuing Calibration

The percent recoveries for the Continuing Calibration Verification (CCV) standard were within QC limits for all constituents.

3. BLANKS

The Initial Calibration Blank (ICB), Continuing Calibration Blanks (CCB) and Preparation Blanks (PB) were analyzed at the appropriate frequencies. No constituents were detected in the ICB, CCB, and PB blanks above the corresponding Contract Required Detection Limit (CRDL).

4. ICP INTERFERENCE CHECK SAMPLE

Results for the ICP analysis of the Interference Check Sample (ICS) solution AB were within 20% of the true value.

5. LABORATORY CONTROL SAMPLES

Recoveries were within the control limit (80-120%) for all constituents.

6. DUPLICATE ANALYSIS

The laboratory used samples SK-SW50-1020 (total and dissolved fractions) for the duplicate samples. The Relative Percent Difference (RPD) between the sample and duplicate results for the total and dissolved fractions were within the acceptance criteria (<20%) for all target analytes.

7. SPIKE SAMPLE ANALYSIS

" like japo"

The laboratory used sample SK-SW50-1020 (total and dissolved) for the matrix spike sample. The MS percent recoveries were within the acceptance criteria (75%-125%) with the exception Arsenic (73%) and Selenium (64%) in the dissolved fraction.

As per the National Functional Guidelines, if the percent recovery is greater than 30% but less than 75% qualify results greater than the IDL with "J" and non-detected results with "UJ".

8. ICP SERIAL DILUTION

As noted in the National Functional Guidelines: If the analyte concentration is at least 50 times above the IDL, its serial dilution analysis must then agree within 10% of the original determination after corrected for dilution. The serial dilution is performed to determine whether any significant chemical or physical interference's exist due to matrix effects. The serial dilution percent differences were within the acceptance criteria for all target analytes for the total fraction only. It should be noted that the laboratory did not analyze a serial dilution for the dissolved fraction.

9. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data.

10. DOCUMENTATION

16 1890

The concentration for Mercury associated with the CRDL was reported as 0.200 when it should have been reported as 0.25608. The percent recovery of Mercury for the CRDL was reported as 93% when it should have been reported as 133%. The data validator manually made the correction.

The laboratory qualified the Lead and Zinc results with an "E" qualifier to indicate that the acceptance criteria for the serial dilution were outside of the control limit. The results should not have been qualified because the initial concentration of the Lead and Zinc were not greater than fifty times the IDL and therefore the 10% criterion did not apply. The data validator manually made the corrections on the Form's I and IX.

11. OVERALL ASSESSMENT

The percent recoveries for Arsenic in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 128%, 119%, and 124%.

The percent recoveries for Manganese in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 121%, 124%, and 124%.

The percent recoveries for Mercury in the Contract Required Detection Limit (CRDL) standards analyzed on 12/11/06 was 133%.

The percent recoveries for Selenium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 135%, 135%, and 146%.

The percent recoveries for Silver in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 122%, 122%, and 120%.

The percent recoveries for Thallium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 107%, 122%, and 116%.

As per the National Functional Guidelines, if the CRDL is below 80% then detected results are qualified as estimated with "J" and non-detected results with "UJ". If the CRDL is above 120% then detected results are qualified as estimated with "J". The results are acceptable with the validator-added qualifiers.

DATA VALIDATION SUMMARY – SAMPLE DELIVERY GROUP 206112905 SEMIVOLATILE ORGANICS

Validation of the Gas Chromatograph/Mass Spectrometer (GC/MS) semi-volatile organics data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999) as appropriate. The results were reported by GCAL under SDG 206112905.

- 10. System Performance
- 11. Documentation
- 12. Overall Assessment

1. HOLDING TIMES

The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C. All samples were extracted within the seven-day technical holding time and the five-day Validated Time of Sample Receipt (VTSR) method holding time.

2. GC/MS TUNING

Miles 188

Sk jage

141000.0

The samples were analyzed on a single GC/MS system, identified as MSSV3. One decafluorotriphenylphosphine (DFTPP) tune was run representing the shift in which the standards and samples were analyzed. The DFTPP tune is acceptable.

3. CALIBRATION

A. Initial Calibration

One IC dated 12/21/06 was analyzed in support of the semivolatile sample analyses. Documentation of the IC was present in the data package, and the Relative Response Factor (RRF), as well as percent Relative Standard Deviation (%RSD) values were accurately reported for all target compounds. The criteria employed for technical data review purposes are different than those used in the method. The laboratory must meet a minimum RRF of 0.01; however, for data review purposes, a RRF criterion of "greater than or equal to 0.05" is applied to all semi-volatile compounds. The RRF's and the average RRF for the IC's were within the acceptance criteria specified in the method for all target compounds. The %RSD's were within the acceptance criteria specified in the method for all target analytes.

B. Continuing Calibration

One CC dated 12/21/06 was analyzed in support of the semivolatile sample analyses reported in the data submissions. The percent difference (%D) between the average RRF's and the CC Response Factors for the CC were within the acceptance criteria (<25%) for the CC dated 12/21/06.

4. BLANKS

One laboratory semivolatile method blank and an Equipment Blank were analyzed with this SDG. The results are summarized below.

Method Blank (MB434692)

Bis(2-ethylhexyl) phthalate was detected at a concentration of 1.12 ppb in the method blank extracted on 12/1/06.

Equipment Blank (SKEB1-1020)

Bis(2-ethylhexyl) phthalate was detected at a concentration of 2.12 ppb in the Equipment Blank collected on 11/29/06.

5. SYSTEM MONITORING COMPOUND RECOVERY

All reported semivolatile system monitoring compounds (SMC) were recovered within acceptable control limits.

6. MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD)

Sample SK-GW58-1020 was submitted for MS/MSD analysis. The MS/MSD percent recoveries were within the acceptance criteria.

7. INTERNAL STANDARDS PERFORMANCE

Internal standard (IS) areas and Retention Times (RT) were within the acceptance limits for the reported semivolatile samples.

8. COMPOUND IDENTIFICATION

All reported semivolatile constituents were correctly identified with supporting chromatograms present in the data package.

9. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported for semivolatile constituents.

10. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data submitted for review.

11. **DOCUMENTATION**

4120-

1 1890°

There was no extraction date listed on the Form IV submitted in the data package. There were no sample volumes, units, levels, date extracted, or preparation method listed on Form I SV-TIC. The analytical method reported by the GCAL on the Form I SV-TIC was listed as SW-846 8270C when it should have been listed as OLM04.2. The data validator manually made the corrections.

12. OVERALL ASSESSMENT

The results are acceptable with the validator-added qualifiers.

DATA VALIDATION SUMMARY – SAMPLE DELIVERY GROUP 206112905 VOLATILE ORGANIC

Validation of the GC/MS volatile organics data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999), as appropriate. The results were reported by GCAL under SDG 206112905.

INTRODUCTION

Analyses were performed according to CLP-Organic Analysis Low Concentration OLC02.0 SOW. Results of the sample analyses are reported by the laboratory as either qualified or unqualified. Unqualified results mean that the reported values may be used without reservation. The laboratory to denote specific information regarding the analytical results uses various qualifier codes. The data validation process is intended to evaluate the data on a technical basis. The data package also was subjected to an internal laboratory quality review prior to submission to Earth Tech for data validation.

During the validation process, laboratory-qualified and unqualified data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data user. Final results are therefore, either qualified or unqualified. Validator-qualified results are annotated with the following codes in accordance with the Functional Guidelines:

- U The constituent was analyzed for, but was not detected above the level of the associated analytical reporting limit. The associated value is either the sample quantitation limit or the sample detection limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

The volatiles data validation findings and conclusions are provided in the following sections of this report:

1. Holding Times

- 2. GC/MS Tuning
- 3. Calibration
 - A. IC
 - B. CC
- 4. Blanks
- 5. System Monitoring Compound Recovery
- 6. MS/MSD
- 7. Laboratory Control Sample
- 8. Internal Standards Performance
- 9. Compound Identification
- 10. Constituent Quantitation and Reported Detection Limits
- 11. System Performance
- 12. Documentation
- 13. Overall Assessment

1. HOLDING TIMES

All samples for Volatile Organic Compounds (VOC) analyses were analyzed within the 14-day technical holding time and the 10-day VTSR method holding time. The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C.

2. GC/MS TUNING

The samples were analyzed one GC/MS system, identified as MSV7. One bromofluorobenzene (BFB) tune was run on MSV7. The BFB tune is acceptable.

3. CALIBRATION

A. Initial Calibration

One IC dated 12/6/06 was analyzed on instrument MSV7 in support of the volatile sample analyses reported in the data submissions. Documentation of the IC standards is present in the data package, and RRF's as well as %RSD values were accurately reported. The criteria employed for technical data review purposes are different than those used in the method. The laboratory must meet a minimum RRF of 0.01; however, for data review purposes, a RRF criterion of "greater than or equal to 0.05" is applied to all volatile compounds.

The RRF's and the average RRF for the IC were within the acceptance criteria specified in the method for all target compounds with the exception of Acetone associated with the IC dated 12/6/06. The %RSD's were within the acceptance criteria specified in the method for all target compounds. As per the National Functional Guidelines, if any IC RRF is less than 0.05 then qualify detected results for that compound with "J" and non-detected results for that compound with "R".

B. Continuing Calibration

One CC dated 12/6/06 was analyzed on instrument MSV7 in support of the volatile sample analyses reported in the data submissions. The percent difference (%D) between the average RRF's and the CC RF's for the CC dated 12/6/06 were within the acceptance criteria for all target compounds. The CC RRF's for the CC dated 12/6/06 were within the acceptance criteria specified in the method for all target compounds with the exception of Acetone. The Acetone results were previously qualified under the Section 3A titled "Initial Calibration" therefore no further action was warranted.

4. BLANKS

Trappo^{je}

One laboratory volatile method blank, a storage blank, two Trip Blanks, and an Equipment Blank were analyzed with this SDG. The results are summarized below.

MB436174

The following compounds were detected in the method blank analyzed on 12/6/06 (1747):

Compound	Concentration
Acetone	1.6 ppb
Tetrachloroethene	0.022 ppb
Ethylbenzene	0.017 ppb
Styrene	0.016 ppb
Total Xylenes	0.057 ppb
1,3-Dichlorobenzene	0.026 ppb
1,2-Dichlorobenzene	0.095 ppb
1,4-Dichlorobenzene	0.048 ppb
1,2,4-Trichlorobenzene	0.073 ppb

Storage Blank (VHBLK)

Chloroform (0.39 ppb), Methylene chloride (0.045 ppb), and Total Xylenes (0.021 ppb) were detected in the in the Storage Blank analyzed on 12/6/06.

Equipment Blank (SKEB1-1020)

The following compounds were detected in the equipment blank collected on 11/29/06 (1600):

Compound	Concentration
Benzene	0.046 ppb
Ethylbenzene	0.043 ppb
Methylene chloride	0.18 ppb
Styrene	0.044 ppb
Tetrachloroethene	0.011 ppb
Toluene	0.19 ppb
Total Xylenes	0.11 ppb

All of the compounds detected in the Equipment Blank (with the exception of Benzene, and Toluene) were mitigated by the presence of Ethylbenzene, Methylene chloride, Styrene, Tetrachloroethene, and Total Xylenes in the associated method blank or storage blank.

Trip Blank

1 1880

Acetone (1.2 ppb), Ethylbezene (0.031 ppb), Methylene chloride (0.17 ppb), Styrene (0.030 ppb) and Total Xylenes (0.030 ppb) were detected in the Trip Blank associated with the sample received on 11/29/06. The Acetone, Ethylbenzene, Styrene, and Total Xylenes in the Trip Blank were mitigated by the presence of Acetone, Ethylbenzene, Styrene, and Total Xylenes in the associated method blank.

Trip Blank

" Harris "

·wigat*

his tane

The following compounds were detected in the Trip Blank associated with the sample received on 11/30/06.

Compound	Concentration
Acetone	3.1 ppb
Chloroform	0.19 ppb
Ethylbenzene	0.033 ppb
Methylene chloride	2.0 ppb
Styrene	0.029 ppb
1,3-Dichlorobenzene	0.017 ppb
1,2-Dichlorobenzene	0.026 ppb
1,2,4-Trichlorobenzene	0.046 ppb

All of the compounds detected in the Trip Blank were mitigated by the presence of Acetone, Chloroform, Ethylbenzene, Methylene chloride, Styrene, 1,2-Dichlorobenzene, 1,3-Dichlorobenzene, and 1,2,4-Trichlorobenzene in the associated method blank or storage blank.

5. SYSTEM MONITORING COMPOUND RECOVERY

All reported volatile system monitoring compounds (SMC) were recovered within acceptable control limits (80%-120%).

6. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Sample SK-GW58-1020 was submitted for the MS/MSD analysis. The MS/MSD percent recoveries were within the acceptance criteria. The RPD between the compounds were within the acceptance criteria.

7. LABORATORY CONTROL SAMPLE

One Laboratory Control Sample was analyzed in conjunction with this SDG. Recoveries were within the control limit for all constituents.

8. INTERNAL STANDARDS PERFORMANCE

Internal Standard (IS) areas and retention times were within acceptable limits for the reported volatile sample analyses.

9. COMPOUND IDENTIFICATION

All reported VOCs were correctly identified with supporting chromatograms present in the data package.

10. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported for VOCs.

11. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data.

12. **DOCUMENTATION**

16- 1000

The documentation submitted for review appeared accurate and in order.

13. OVERALL ASSESSMENT

The results are acceptable with the validator-added qualifiers.

DATA VALIDATION SUMMARY - SAMPLE DELIVERY GROUP 206112905 PESTICIDES

Validation of the Gas Chromatography (GC) pesticides data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999), as appropriate. The results were reported by GCAL under SDG 206112905.

- 10. Constituent Quantitation and Reported Detection Limits
- 11. Documentation
- 12. Overall Assessment

1. HOLDING TIMES

The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C. All samples were extracted within the seven-day technical holding time and the five-day Validated Time of Sample Receipt (VTSR) method holding time with the exception of samples SKGW06R-1020 and SKGW59-1020. As per the National Functional Guidelines, if the holding time is exceeded then qualify detected results with "J" and non-detected results with "UJ".

2. GC/ECD INSTRUMENT PERFORMANCE CHECK

The Performance Evaluation Mixture (PEM) was analyzed at the correct frequency. Absolute retention times were within limits. The percent resolution between adjacent peaks was within QC limits for the Pesticide Analyte Resolution Check. The percent resolution between adjacent peaks is within QC limits for the Performance Evaluation Mixtures (PEM).

The percent breakdown for both 4,4'-DDT and Endrin in each PEM was less than 20.0% for both GC columns. The combined percent breakdown for 4,4'-DDT and Endrin in each PEM was less than 30.0% for both GC columns.

3. INITIAL CALIBRATION

Individual standard mixtures A and B were analyzed at the correct frequencies and concentrations. The percent resolution criterion for Individual standard mixtures A and B were within the acceptance criteria.

The Percent Relative Standard Deviation (%RSD) of the calibration factors for each of the single component pesticides was less than 20%. The multi-component target compounds were analyzed separately on both columns at a single concentration level. Retention times were determined from a minimum of three peaks.

4. CALIBRATION VERIFICATION

Absolute retention times were within appropriate time retention windows. The percent difference for each of the pesticides and surrogates in the PEM's were within the acceptance criteria of =25.0 percent for the calibration verifications.

The percent difference for each of the pesticides and surrogates in the midpoint concentration of the Individual Standard Mixtures A and B.

5. BLANKS

" 1800^j

Two laboratory method blanks and an Equipment blank were analyzed with this SDG. The results are summarized below.

Method Blank 434691

No constituents were reported by GCAL for the method blank extracted on 12/1/06.

Method Blank 436322

No constituents were reported by GCAL for the method blank extracted on 12/7/06.

Equipment Blank SK-GWEB-1020

No target compounds were detected in the Equipment Blank collected on 11/29/06.

6. SURROGATE SPIKES

· in jest

1 1885

Decachlorobiphenyl (DCB) and tetrachloro-m-xylene (TCX) surrogate spike recoveries were within the acceptance criteria (30% - 150%).

7. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Sample SK-GW58-1020 was submitted for MS/MSD analysis. All of the percent recoveries associated with the MS/MSD were within the acceptance criteria with the exception of the following: Lindane associated with the MS/MSD. All of the RPD's between the MS/MSD were within the acceptance criteria. As per the National Functional Guidelines, no action is taken on MS/MSD data alone.

8. PESTICIDE CLEANUP CHECKS

Recoveries of all pesticides and surrogates were within 80-120% for the lot of Florisil cartridges utilized for pesticide cleanup.

9. TARGET COMPOUND IDENTIFICATION

All reported pesticide data were correctly identified with supporting chromatograms present in the data package.

10. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported with the exception of the results for samples SK-GW58-1020 MS and SK-GW58-1020 MSD. The data validator manually made the corrections.

11. DOCUMENTATION

The extraction type and date extracted was not reported on Form IV for method blank 413580. The data validator manually made the correction.

12. OVERALL ASSESSMENT

The results are acceptable as qualified by the data validator.

CASE NARRATIVE

Client: Earth Tech Report: 206112905

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the sample cross-reference page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

SEMI-VOLATILES GAS CHROMATOGRAPHY

In the OLM04.2 - CLP Pest/PCB analysis for prep batch 338064, the MS/MSD exhibited recovery failures. These recoveries were within limits in the LCS and/or LCSD. This is attributed to matrix interference.

METALS

in tees.

In the ILM04.1 - CLP Metals analysis for prep batch 338112, the MS and/or MSD recoveries were outside the control limits for Arsenic and Selenium. The LCS recovery was within control limits. This indicates the analysis is in control and the sample is affected by matrix interference. The MS recovery is not applicable for Iron because the sample concentration is greater than four times the spike concentration. Lead and Zinc are flagged as estimated due to the fact that the percent difference between the original sample result and the serial dilution result is greater than 10. A chemical or physical interference is suspected.

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations Utilized in this Report

ND Indicates the result was Not Detected at the specified RDL

DO Indicates the result was Diluted Out

MI Indicates the result was subject to Matrix Interference Indicates the result was Too Numerous To Count SUBC Indicates the analysis was Sub-Contracted

Indicates the analysis was performed in the Field FLD

Practical Quantitation Limit PQL Method Detection Limit MDL Reporting Detection Limit RDL

Reported as a time equivalent to 12:00 AM 00:00

Reporting Flags Utilized in this Report

J Indicates an estimated value

U Indicates the compound was analyzed for but not detected

В (ORGANICS) Indicates the analyte was detected in the associated Method Blank

В (INORGANICS) Indicates the result is between the RDL and MDL

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with ISO Guide 25 and NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

## DATA VALIDATION SUMMARY – SAMPLE DELIVERY GROUP 206120124 INORGANICS

Validation of the inorganics data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November and December 2006, was conducted by Earth Tech using the National Functional Guidelines for Inorganic Data Review, (US EPA, February, 1994), as appropriate. The results were reported by GCAL under Sample Delivery Group (SDG) 206120124.

#### **INTRODUCTION**

Analyses of metals were performed according to Contract Laboratory Program (CLP)-Inorganic Analysis Multi-media Multi-concentration ILM04.1 Statement of Work (SOW). Results of the sample analyses are reported by the laboratory as either qualified or unqualified. Unqualified results mean that the reported values maybe used without reservation. The laboratory to denote specific information regarding the analytical results uses various qualifier codes.

The data validation process is intended to evaluate the data on a technical basis. The data package also was subjected to an internal laboratory quality review prior to submission to Earth Tech for data validation.

During the validation process, laboratory-qualified and unqualified data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data user.

Final results are therefore, either qualified or unqualified. Validator-qualified results are annotated with the following codes in accordance with the Functional Guidelines:

- U The constituent was analyzed for, but was not detected above the level of the associated analytical reporting limit. The associated value is either the sample quantitation limit or the sample detection limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Details of the inorganics data validation findings and conclusions are provided in the following sections of this report:

- 1. Holding Times
- 2. Calibration

- A. Initial Calibration (IC)
- B. Continuing Calibration (CC)
- 3. Blanks
- 4. Inductively Coupled Plasma (ICP) Interference Check Sample
- 5. Laboratory Control Sample (LCS)
- 6. Duplicate Analysis
- 7. Spike Sample Analysis
- 8. ICP Serial Dilution
- 9. System Performance

- 10. Documentation
- 11. Overall Assessment

#### 1. HOLDING TIMES

MI IEEE

1 1410

All samples for inorganics analyses were analyzed within the 180-day holding time for preserved aqueous samples. Mercury analyses were conducted within the 28-day holding time for aqueous samples undergoing CLP protocol. Cyanide analyses were conducted within the 14-day holding time. The cooler temperature upon receipt at the laboratory was within the recommended temperature of  $4^{\circ}\text{C}$  +/-  $2^{\circ}\text{C}$ .

## 2. CALIBRATION

#### A. Initial Calibration

The percent recoveries for the Initial Calibration Verification (ICV) standard were within Quality Control (QC) limits for all constituents.

## B. Continuing Calibration

The percent recoveries for the Continuing Calibration Verification (CCV) standard were within OC limits for all constituents.

#### 3. BLANKS

The Initial Calibration Blank (ICB), Continuing Calibration Blanks (CCB) and Preparation Blanks (PB) were analyzed at the appropriate frequencies. No constituents were detected in the ICB, CCB, and PB blanks above the corresponding Contract Required Detection Limit (CRDL).

#### 4. ICP INTERFERENCE CHECK SAMPLE

Results for the ICP analysis of the Interference Check Sample (ICS) solution AB were within 20% of the true value.

#### 5. LABORATORY CONTROL SAMPLES

Recoveries were within the control limit (80-120%) for all constituents.

#### 6. DUPLICATE ANALYSIS

The laboratory used samples SK-SW50-1020 (total and dissolved) and SK-SW85-1020 (total and dissolved) for the duplicate samples. The Relative Percent Difference (RPD) between the sample and duplicate results for the total and dissolved fractions were within the acceptance criteria (<20%) for all target analytes.

#### 7. SPIKE SAMPLE ANALYSIS

The laboratory used samples SK-SW50-1020 (total and dissolved) and SK-SW85-1020 (total and dissolved) for the matrix spike sample. The MS percent recoveries were within the acceptance criteria (75%-125%) except as follows:

| Arsenic (70%) | SK-SW50-1020 total fraction     |
|---------------|---------------------------------|
| Arsenic (70%) | SK-SW50-1020 dissolved fraction |
| Arsenic (70%) | SK-SW85-1020 dissolved fraction |
| Selenium (0%) | SK-SW85-1020 dissolved fraction |

As per the National Functional Guidelines, if the percent recovery is greater than 30% but less than 75% qualify results greater than the IDL with "J" and non-detected results with "UJ". If the percent recovery is less than 30% qualify detected results for that analyte with "J" and non-detected results for that analyte with "R".

## 8. ICP SERIAL DILUTION

As noted in the National Functional Guidelines: If the analyte concentration is at least 50 times above the IDL, its serial dilution analysis must then agree within 10% of the original determination after corrected for dilution. The serial dilution is performed to determine whether any significant chemical or physical interference's exist due to matrix effects. The serial dilution percent differences were within the acceptance criteria for all target analytes with the exception of Calcium, Iron, Magnesium, Potassium, and Sodium. As per the National Functional Guidelines, if the serial dilution percent criterion is not meet then qualify the associated data as estimated with a "J".

It should be noted that the laboratory did not analyze a serial dilution for the dissolved fraction.

#### 9. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data.

#### 10. DOCUMENTATION

Name P

I was no year

The concentration for Mercury associated with the CRDL was reported as 0.300 when it should have been reported as 0.25608. The data validator manually made the correction.

The laboratory qualified the Aluminum results with an "E" qualifier to indicate that the acceptance criteria for the serial dilution were outside of the control limit. The results should not have been qualified because the initial concentration of the Aluminum was not greater than fifty times the IDL and therefore the 10% criterion did not apply. The data validator manually made the corrections on the Form's I and IX.

#### 11. OVERALL ASSESSMENT

14 1600

N 1090-

\*100

The percent recoveries for Arsenic in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 128%, 119%, and 122%.

The percent recoveries for Manganese in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 121%, 124%, and 124%.

The percent recoveries for Mercury in the Contract Required Detection Limit (CRDL) standards analyzed on 12/11/06 was 133%.

The percent recoveries for Selenium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 135%, 135%, and 146%.

The percent recoveries for Silver in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 122%, 122%, and 120%.

The percent recoveries for Thallium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/12/06 were 107%, 122%, and 116%.

The percent recoveries for Arsenic in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 134 and 124%.

The percent recoveries for Chromium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 123% and 124%.

The percent recoveries for Manganese in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 128% and 127%.

The percent recoveries for Selenium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 117% and 136%.

As per the National Functional Guidelines, if the CRDL is above 120% then detected results are qualified as estimated with "J".

The results are acceptable with the validator-added qualifiers.

## DATA VALIDATION SUMMARY – SAMPLE DELIVERY GROUP 206120124 SEMIVOLATILE ORGANICS

Validation of the Gas Chromatograph/Mass Spectrometer (GC/MS) semi-volatile organics data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November and December 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999) as appropriate. The results were reported by GCAL under SDG 206120124.

#### 1. HOLDING TIMES

William P

1490

All samples for Volatile Organic Compounds (VOC) analyses were analyzed within the 14-day technical holding time and the 10-day VTSR method holding time. The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C.

#### 2. GC/MS TUNING

The samples were analyzed one GC/MS system, identified as MSV7. Two bromofluorobenzene (BFB) tunes were run on MSV7. The BFB tunes are acceptable.

#### 3. CALIBRATION

#### A. Initial Calibration

One IC dated 12/6/06 was analyzed on instrument MSV7 in support of the volatile sample analyses reported in the data submissions. Documentation of the IC standards is present in the data package, and RRF's as well as %RSD values were accurately reported. The criteria employed for technical data review purposes are different than those used in the method. The laboratory must meet a minimum RRF of 0.01; however, for data review purposes, a RRF criterion of "greater than or equal to 0.05" is applied to all volatile compounds.

The RRF's and the average RRF for the IC were within the acceptance criteria specified in the method for all target compounds with the exception of Acetone associated with the IC dated 12/6/06. The %RSD's were within the acceptance criteria specified in the method for all target compounds. As per the National Functional Guidelines, if any IC RRF is less than 0.05 then qualify detected results for that compound with "J" and non-detected results for that compound with "R".

## B. Continuing Calibration

Two CC's dated 12/6/06 and 12/7/06 were analyzed on instrument MSV7 in support of the volatile sample analyses reported in the data submissions. The percent difference (%D) between the average RRF's and the CC RF's for the CC dated 12/6/06 were within the acceptance criteria for all target compounds. The CC RRF's for the CC's dated 12/6/06 and 12/7/06 were within the acceptance criteria specified in the method for all target compounds with the exception of Acetone. The Acetone results were previously qualified under the Section 3A titled "Initial Calibration" therefore no further action was warranted.

## 4. BLANKS

Two laboratory volatile method blanks, a storage blank, two Trip Blanks, and an Equipment Blank were analyzed with this SDG. The results are summarized below.

## MB436174

The following compounds were detected in the method blank analyzed on 12/6/06 (1747):

| Compound               | Concentration |
|------------------------|---------------|
| Acetone                | 1.6 ppb       |
| Tetrachloroethene      | 0.022 ppb     |
| Ethylbenzene           | 0.017 ppb     |
| Styrene                | 0.016 ppb     |
| Total Xylenes          | 0.057 ppb     |
| 1,3-Dichlorobenzene    | 0.026 ppb     |
| 1,2-Dichlorobenzene    | 0.095 ppb     |
| 1,4-Dichlorobenzene    | 0.048 ppb     |
| 1,2,4-Trichlorobenzene | 0.073 ppb     |

## MB436374

II. I Dagge

The following compounds were detected in the method blank analyzed on 12/7/06 (0927):

| Compound               | <u>Concentration</u> |
|------------------------|----------------------|
| Acetone                | 1.6 ppb              |
| Total Xylenes          | 0.019 ppb            |
| 1,3-Dichlorobenzene    | 0.012 ppb            |
| 1,2-Dichlorobenzene    | 0.071 ppb            |
| 1,2,4-Trichlorobenzene | 0.033 ppb            |

## Storage Blank (VHBLK)

The following compounds were detected in the in the Storage Blank analyzed on 12/7/06.

| Compound               | Concentration |
|------------------------|---------------|
| 1,2,4-Trichlorobenzene | 0.034 ppb     |
| 1,2-Dichlorobenzene    | 0.070 ppb     |
| 1,3-Dichlorobenzene    | 0.014 ppb     |
| Methylene chloride     | 0.10 ppb      |
| Total Xylenes          | 0.021 ppb     |

## Equipment Blank (SKEB2-1020)

The following compounds were detected in the equipment blank collected on 11/30/06 (1610):

| Compound           | Concentration |
|--------------------|---------------|
| Benzene            | 0.037 ppb     |
| Ethylbenzene       | 0.041 ppb     |
| Methylene chloride | 0.19 ppb      |
| Styrene            | 0.023 ppb     |

| Compound      | <u>Concentration</u> |
|---------------|----------------------|
| Toluene       | 0.16 ppb             |
| Total Xylenes | 0.082 ppb            |

The Ethylbenzene and Styrene detected in the Equipment Blank (with the exception of Benzene, and Toluene) were mitigated by the presence of Ethylbenzene, Methylene chloride, and Styrene in the associated method blank or storage blank.

## Trip Blank

41,1892

1800

Acetone (2.3 ppb), Ethylbezene (0.024 ppb), Methylene chloride (2.1 ppb), Styrene (0.028 ppb) and 2-Butanone (0.65 ppb) were detected in the Trip Blank associated with the sample received on 12/1/06. The Acetone, Ethylbenzene, Methylene chloride, and Styrene detected in the Trip Blank were mitigated by the presence of Acetone, Ethylbenzene, Methylene chloride, and Styrene in the associated method blank or storage blank.

#### Trip Blank

The following compounds were detected in the Trip Blank associated with the sample received on 12/2/06.

| Compound           | <u>Concentration</u> |
|--------------------|----------------------|
| Acetone            | 4.7 ppb              |
| 2-Butanone         | 1.0 ppb              |
| Chloroform         | 0.022 ppb            |
| Ethylbenzene       | 0.027 ppb            |
| Methylene chloride | 2.4 ppb              |
| Styrene            | 0.036 ppb            |
| Total Xylenes      | 0.012 ppb            |

The Acetone, Ethylbenzene, Methylene chloride, Styrene, and Total Xylenes detected in the Trip Blank were mitigated by the presence of Acetone, Ethylbenzene, Methylene chloride, Styrene, and Total Xylenes in the associated method blank or storage blank.

## 5. SYSTEM MONITORING COMPOUND RECOVERY

All reported volatile system monitoring compounds (SMC) were recovered within acceptable control limits (80%-120%).

#### 6. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Samples SK-SW50-1020 and SK-SW85-1020 were submitted for the MS/MSD analysis. The MS/MSD percent recoveries were within the acceptance criteria. The RPD between the compounds were within the acceptance criteria.

## 7. LABORATORY CONTROL SAMPLE

Two Laboratory Control Samples were analyzed in conjunction with this SDG. Recoveries were within the control limit for all constituents.

#### 8. INTERNAL STANDARDS PERFORMANCE

Internal Standard (IS) areas and retention times were within acceptable limits for the reported volatile sample analyses.

## 9. COMPOUND IDENTIFICATION

All reported VOCs were correctly identified with supporting chromatograms present in the data package.

## 10. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported for VOCs.

## 11. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data.

#### 12. DOCUMENTATION

There was no Form III VOA for the reporting of the LCS percent recoveries. The data validator made the calculations manually.

#### 13. OVERALL ASSESSMENT

The results are acceptable with the validator-added qualifiers.

# DATA VALIDATION SUMMARY - SAMPLE DELIVERY GROUP 206120124 PESTICIDES

Validation of the Gas Chromatography (GC) pesticides data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in November and December 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999), as appropriate. The results were reported by GCAL under SDG 206120124.

| GCAL #      | Sample Description |
|-------------|--------------------|
| 20612012401 | SKEB2-1020         |
| 20612012403 | SKSW50-1020        |

#### INTRODUCTION

Analyses were performed according to CLP-Organic Analysis Multi-Media, Multi-Concentration OLM04.2 SOW. Results of the sample analyses are reported by the laboratory as either qualified or unqualified. Unqualified results mean that the reported values may be used without reservation. Various qualifier codes are used by the laboratory to denote specific information regarding the analytical results.

The data validation process is intended to evaluate the data on a technical basis. The data package also was subjected to an internal laboratory quality review prior to submission to Earth Tech for data validation.

During the validation process, laboratory-qualified and unqualified data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data user. Final results are therefore, either qualified or unqualified. Validator-qualified results are annotated with the following codes in accordance with the Functional Guidelines:

- U The constituent was analyzed for, but was not detected above the level of the associated analytical reporting limit. The associated value is either the sample quantitation limit or the sample detection limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

14, 1897

I HER

1500 "

- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Details of the pesticide data validation findings and conclusions are provided in the following sections of this report:

- 1. Holding Times
- 2. Gas Chromatograph/Electronic Capture Detector (GC/ECD) Instrument Performance Check
- 3. IC

Library.

- 4. Calibration Verification
- 5. Blanks
- 6. Surrogate Spikes
- 7. Matrix Spike/Matrix Spike Duplicate (MS/MSD)
- 8. Pesticide Cleanup Checks
- 9. Target Compound Identification
- 10. Constituent Quantitation and Reported Detection Limits
- 11. Documentation
- 12. Overall Assessment

### 1. HOLDING TIMES

The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C. All samples were extracted within the seven-day technical holding time and the five-day Validated Time of Sample Receipt (VTSR) method holding time.

#### 2. GC/ECD INSTRUMENT PERFORMANCE CHECK

The Performance Evaluation Mixture (PEM) was analyzed at the correct frequency. Absolute retention times were within limits. The percent resolution between adjacent peaks was within QC limits for the Pesticide Analyte Resolution Check. The percent resolution between adjacent peaks is within QC limits for the Performance Evaluation Mixtures (PEM).

The percent breakdown for both 4,4'-DDT and Endrin in each PEM was less than 20.0% for both GC columns. The combined percent breakdown for 4,4'-DDT and Endrin in each PEM was less than 30.0% for both GC columns.

#### 3. INITIAL CALIBRATION

t, .....

19 159+

188\*

Individual standard mixtures A and B were analyzed at the correct frequencies and concentrations. The percent resolution criterion for Individual standard mixtures A and B were within the acceptance criteria.

The Percent Relative Standard Deviation (%RSD) of the calibration factors for each of the single component pesticides was less than 20%. The multi-component target compounds were analyzed separately on both columns at a single concentration level. Retention times were determined from a minimum of three peaks.

#### 4. CALIBRATION VERIFICATION

Absolute retention times were within appropriate time retention windows. The percent difference for each of the pesticides and surrogates in the PEM's were within the acceptance criteria of  $\pm 25.0$  percent for the calibration verifications.

#### 5. BLANKS

Three laboratory method blanks and an Equipment blank were analyzed with this SDG. The results are summarized below.

#### Method Blank 434691

No constituents were reported by GCAL for the method blank extracted on 12/1/06.

#### Method Blank 435221

No constituents were reported by GCAL for the method blank extracted on 12/4/06.

## Method Blank 436322

No constituents were reported by GCAL for the method blank extracted on 12/7/06.

## Equipment Blank SKEB-1020

No target compounds were detected in the Equipment Blank collected on 11/30/06.

#### 6. SURROGATE SPIKES

Decachlorobiphenyl (DCB) and tetrachloro-m-xylene (TCX) surrogate spike recoveries were within the acceptance criteria (30% - 150%).

#### 7. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Samples SK-SW50-1020 and SK-SW85-1020 were submitted for MS/MSD analysis. All of the percent recoveries associated with the MS/MSD were within the acceptance criteria with the exception of the following: Lindane associated with the MS/MSD for sample SK-SW50-1020. All of the RPD's between the MS/MSD were within the acceptance criteria except for Lindane associated with sample for sample SK-SW50-1020. As per the National Functional Guidelines, no action is taken on MS/MSD data alone.

#### 8. PESTICIDE CLEANUP CHECKS

Recoveries of all pesticides and surrogates were within 80-120% for the lot of Florisil cartridges utilized for pesticide cleanup.

#### 9. TARGET COMPOUND IDENTIFICATION

All reported pesticide data were correctly identified with supporting chromatograms present in the data package.

## 10. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported.

#### 11. **DOCUMENTATION**

The extraction type and date extracted was not reported on Form IV for method blank 413580. The data validator manually made the correction.

#### 12. OVERALL ASSESSMENT

The results are acceptable as qualified by the data validator.

#### INTRODUCTION

Analyses of metals were performed according to Contract Laboratory Program (CLP)-Inorganic Analysis Multi-media Multi-concentration ILM04.1 Statement of Work (SOW). Results of the sample analyses are reported by the laboratory as either qualified or unqualified. Unqualified results mean that the reported values maybe used without reservation. The laboratory to denote specific information regarding the analytical results uses various qualifier codes.

The data validation process is intended to evaluate the data on a technical basis. The data package also was subjected to an internal laboratory quality review prior to submission to Earth Tech for data validation.

During the validation process, laboratory-qualified and unqualified data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data user.

Final results are therefore, either qualified or unqualified. Validator-qualified results are annotated with the following codes in accordance with the Functional Guidelines:

U The constituent was analyzed for, but was not detected above the level of the associated analytical reporting limit. The associated value is either the sample quantitation limit or the sample detection limit.

- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Details of the inorganics data validation findings and conclusions are provided in the following sections of this report:

- 1. Holding Times
- 2. Calibration
  - A. Initial Calibration (IC)
  - B. Continuing Calibration (CC)
- 3. Blanks

<sup>a,</sup> lighe<sup>alt</sup>

- 4. Inductively Coupled Plasma (ICP) Interference Check Sample
- 5. Laboratory Control Sample (LCS)
- 6. Duplicate Analysis
- 7. Spike Sample Analysis
- 8. ICP Serial Dilution
- 9. System Performance
- 10. Documentation
- 11. Overall Assessment

#### 1. HOLDING TIMES

All samples for inorganics analyses were analyzed within the 180-day holding time for preserved aqueous samples. Mercury analyses were conducted within the 28-day holding time for aqueous samples undergoing CLP protocol.

Cyanide analyses were conducted within the 14-day holding time. The cooler temperature upon receipt at the laboratory was within the recommended temperature of  $4^{\circ}\text{C}$  +/-  $2^{\circ}\text{C}$ .

#### 2. CALIBRATION

Sections.

" ande"

#### A. Initial Calibration

The percent recoveries for the Initial Calibration Verification (ICV) standard were within Quality Control (QC) limits for all constituents.

## B. Continuing Calibration

The percent recoveries for the Continuing Calibration Verification (CCV) standard were within OC limits for all constituents.

#### 3. BLANKS

The Initial Calibration Blank (ICB), Continuing Calibration Blanks (CCB) and Preparation Blanks (PB) were analyzed at the appropriate frequencies. No constituents were detected in the ICB, and CCB blanks above the corresponding Contract Required Detection Limit (CRDL). Selenium (-5.300) was detected above the CRDL in the preparation blank.

If any analyte concentration in the PB is above the CRDL, the lowest concentration of that analyte in the associated samples must be 10 times the PB concentration. Otherwise, all samples associated with that PB with the analyte's concentration less than 10 times the PB concentration, and above the CRDL, should have been re-digested and re-analyzed for that analyte (except for an identified aqueous soil field blank). The sample concentration is not to be corrected for the blank value. If the concentration of the PB for a certain analyte is below the negative CRDL, then all samples reported below 10 times the CRDL (associated with that analyte in that blank), should have been re-digested and re-analyzed.

As per the National Functional Guidelines, any blank reported with a negative result whose absolute value is greater than the IDL must be carefully evaluated to determine its effect on the sample data. The data validator qualified detected results for Selenium with "J" and non-detected results with "UJ".

### 4. ICP INTERFERENCE CHECK SAMPLE

Results for the ICP analysis of the Interference Check Sample (ICS) solution AB were within 20% of the true value.

## 5. LABORATORY CONTROL SAMPLES

Recoveries were within the control limit (80-120%) for all constituents.

#### 6. **DUPLICATE ANALYSIS**

The laboratory used sample SK-GW60-1020 (total) for the duplicate samples. The Relative Percent Difference (RPD) between the sample and duplicate results for the total and dissolved fractions were within the acceptance criteria (<20%) for all target analytes.

#### 7. SPIKE SAMPLE ANALYSIS

The laboratory used samples SK-GW60-1020 (total)) for the matrix spike sample. The MS percent recoveries were within the acceptance criteria (75%-125%).

#### 8. ICP SERIAL DILUTION

As noted in the National Functional Guidelines: If the analyte concentration is at least 50 times above the IDL, its serial dilution analysis must then agree within 10% of the original determination after corrected for dilution. The serial dilution is performed to determine whether any significant chemical or physical interference's exist due to matrix effects.

The serial dilution percent differences were within the acceptance criteria for all target analytes with the exception of Aluminum, Barium, Chromium, and Potassium. As per the National Functional Guidelines, if the serial dilution percent criterion is not meet then qualify the associated data as estimated with a "J".

It should be noted that the laboratory did not analyze a serial dilution for the dissolved fraction.

## 9. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data.

## 10. DOCUMENTATION

The laboratory qualified the Lead results with an "E" qualifier to indicate that the acceptance criteria for the serial dilution were outside of the control limit. The results should not have been qualified because the initial concentration of the Lead was not greater than fifty times the IDL and therefore the 10% criterion did not apply. The data validator manually made the corrections on the Form's I and IX.

#### 11. OVERALL ASSESSMENT

The percent recoveries for Arsenic in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 134 and 124%.

The percent recoveries for Chromium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 123% and 124%.

The percent recoveries for Manganese in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 128% and 127%.

The percent recoveries for Selenium in the Contract Required Detection Limit (CRDL) standards analyzed on 12/21/06 were 117% and 136%.

As per the National Functional Guidelines, if the CRDL is above 120% then detected results are qualified as estimated with "J".

and the second second

The results are acceptable with the validator-added qualifiers.

- 7. Internal Standards Performance
- 8. Compound Identification
- 9. Constituent Quantitation and Reported Detection Limits
- 10. System Performance
- 11. Documentation
- 12. Overall Assessment

### 1. HOLDING TIMES

The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C. All samples were initially extracted within the seven-day technical holding time and the five-day Validated Time of Sample Receipt (VTSR) method holding time.

Samples SKGW60-1020, SKGW63-1020, and SKGW64-1020 were re-extracted due high levels of bis(2-ethylhexyl)phthalate detected in method blank MB435994. The re-extraction was performed outside of the recommended seven-day technical holding time and the five-day Validated Time of Sample Receipt (VTSR) method holding time.

As per the National Functional Guidelines, if the holding time is exceeded then qualify detected results with "J" and non-detected results with "UJ".

#### 2. GC/MS TUNING

The samples were analyzed on a single GC/MS system, identified as MSSV3. Two decafluorotriphenylphosphine (DFTPP) tunes were run representing the shift in which the standards and samples were analyzed. The DFTPP tunes are acceptable.

#### 3. CALIBRATION

#### A. Initial Calibration

Two ICs dated 12/21/06 and 12/26/06 were analyzed on instrument MSSV3 in support of the semivolatile sample analyses. Documentation of the IC was present in the data package, and the Relative Response Factor (RRF), as well as percent Relative Standard Deviation (%RSD) values were accurately reported for all target compounds. The criteria employed for technical data review purposes are different than those used in the method. The laboratory must meet a minimum RRF of 0.01; however, for data review purposes, a RRF criterion of "greater than or equal to 0.05" is applied to all semi-volatile compounds. The RRF's and the average RRF for the IC's were within the acceptance criteria specified in the method for all target compounds associated with the IC dated 12/21/06. The %RSD's were within the acceptance criteria specified in the method for all target compounds with the exception of 4-Chloroaniline associated with the IC dated 12/26/06. The data validator dropped the highest point of the calibration curve for 4-Chloroaniline and re-calculated the %RSD. The re-calculated %RSD for 4-Chloroaniline was 25.8% which is within the acceptance criteria of less than or equal to 30%.

# B. Continuing Calibration

Two CC's dated 12/21/06 and 12/26/06 were analyzed in support of the semivolatile sample analyses reported in the data submissions. The percent difference (%D) between the average RRF's and the CC Response Factors for the CC were within the acceptance criteria (<25%) for the CC dated 12/21/06. The percent difference (%D) between the average RRF's and the CC Response Factors for the CC were within the acceptance criteria (<25%) for the CC dated 12/26/06 with the exception of 4-Chloroaniline (30.8%). As per the National Functional Guidelines, if the %D is outside the  $\pm$  25% criterion then qualify detected results for that compound with "J" and non-detected results for that compound with "UJ".

## 4. BLANKS

· lange

Three laboratory semivolatile method blanks were analyzed with this SDG. The results are summarized below.

# Method Blank (MB435994)

-

1999

Bis(2-ethylhexyl)phthalate (317 ppb) and diethylphthalate (0.577 ppb) were detected in the method blank extracted on 12/6/06.

# Method Blank (MB437688)

Bis(2-ethylhexyl)phthalate (0.811 ppb) and di-n-butylphthalate (1.43 ppb) were detected in the method blank extracted on 12/12/06.

# Method Blank (MB443446)

Bis(2-ethylhexyl)phthalate (1.93 ppb) and di-n-butylphthalate (1.64 ppb) were detected in the method blank extracted on 12/21/06.

# 5. SYSTEM MONITORING COMPOUND RECOVERY

All reported semivolatile system monitoring compounds (SMC) were recovered within acceptable control limits with the exception of 2-Fluorobiphenyl (high), Phenol-d5 (< 10%), and 2,4,6-Tribromophenol (high) associated with SKGW60-1020. As per the National Functional Guidelines, if two or more SMC have a recovery greater than the acceptance criteria qualify detected compounds for that fraction with "J". If any SMC has a recovery less than 10% qualify detected compounds for that fraction with "J" and non-detected results are qualified with "R".

# 6. MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD)

There were no samples submitted for MS/MSD analysis with this batch of samples.

# 7. INTERNAL STANDARDS PERFORMANCE

Internal standard (IS) areas and Retention Times (RT) were within the acceptance limits for the reported semivolatile samples with the exception of Perylene-d12 (extremely low) associated with SKGW60-1020. As per the National Functional Guidelines, if the IS area count is outside 50 percent or +100 percent of the area for the associated standard then qualify detected results with "J". Non-detected compounds quantified using an IS area count less than 50 percent are qualified with "UJ" unless the area count is extremely low in which the non-detected results are qualified with "R".

#### 8. COMPOUND IDENTIFICATION

All reported semivolatile constituents were correctly identified with supporting chromatograms present in the data package.

# 9. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported for semivolatile constituents.

# 10. SYSTEM PERFORMANCE

The analytical system appears to have been working well at the time of these analyses, based on the evaluation of the raw data submitted for review.

#### 11. DOCUMENTATION

H. Ingerê

4:4100

There was no extraction date listed on the Form IV submitted in the data package. There were no sample volumes, units, levels, date extracted, or preparation method listed on Form I SV-TIC. The analytical method reported by the GCAL on the Form I SV-TIC was listed as SW-846 8270C when it should have been listed as OLM04.2. The data validator manually made the corrections.

#### 12. OVERALL ASSESSMENT

Although the re-extraction of sample SKGW60-1020 was performed outside the recommended time frame there were QC related issues with the results from the initial extraction which in turn caused several compounds to be rejected, therefore the data validator recommends using the results for sample SKGW60-1020 extracted on 12/21/06 for reporting purposes. The results are acceptable with the validator-added qualifiers.

# DATA VALIDATION SUMMARY – SAMPLE DELIVERY GROUP 206120608 VOLATILE ORGANIC

Validation of the GC/MS volatile organics data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in December 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999), as appropriate. The results were reported by GCAL under SDG 206120608.

| GCAL#       | Sample Description |

#### INTRODUCTION

Analyses were performed according to CLP-Organic Analysis Low Concentration OLC02.0 SOW. Results of the sample analyses are reported by the laboratory as either qualified or unqualified. Unqualified results mean that the reported values may be used without reservation. The laboratory to denote specific information regarding the analytical results uses various qualifier codes. The data validation process is intended to evaluate the data on a technical basis. The data package also was subjected to an internal laboratory quality review prior to submission to Earth Tech for data validation.

During the validation process, laboratory-qualified and unqualified data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data user. Final results are therefore, either qualified or unqualified. Validator-qualified results are annotated with the following codes in accordance with the Functional Guidelines:

- U The constituent was analyzed for, but was not detected above the level of the associated analytical reporting limit. The associated value is either the sample quantitation limit or the sample detection limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

The volatiles data validation findings and conclusions are provided in the following sections of this report:

- 1. Holding Times
- 2. GC/MS Tuning
- 3. Calibration
  - A. IC
  - B. CC
- 4. Blanks
- 5. System Monitoring Compound Recovery
- 6. MS/MSD
- 7. Laboratory Control Sample
- 8. Internal Standards Performance
- 9. Compound Identification
- 10. Constituent Quantitation and Reported Detection Limits
- 11. System Performance
- 12. Documentation
- 13. Overall Assessment

# 1. HOLDING TIMES

All samples for Volatile Organic Compounds (VOC) analyses were analyzed within the 14-day technical holding time and the 10-day VTSR method holding time. The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C.

## 2. GC/MS TUNING

44,000

\*4 18am

. ...

The samples were analyzed two GC/MS systems, identified as MSV6 and MSV7. Two bromofluorobenzene (BFB) tunes were run on MSV7 and one BFB tune was run on MSV6. The BFB tunes are acceptable.

### 3. CALIBRATION

#### A. Initial Calibration

One IC dated 12/6/06 was analyzed on instrument MSV7 and one IC dated 12/16/06 was analyzed on instrument MSV6 in support of the volatile sample analyses reported in the data submissions. Documentation of the IC standards is present in the data package, and RRF's as well as %RSD values were accurately reported. The criteria employed for technical data review purposes are different than those used in the method. The laboratory must meet a minimum RRF of 0.01; however, for data review purposes, a RRF criterion of "greater than or equal to 0.05" is applied to all volatile compounds.

The RRF's and the average RRF for the IC were within the acceptance criteria specified in the method for all target compounds with the exception of Acetone associated with the IC's. The %RSD's were within the acceptance criteria specified in the method for all target compounds. As per the National Functional Guidelines, if any IC RRF is less than 0.05 then qualify detected results for that compound with "J" and non-detected results for that compound with "R".

# B. Continuing Calibration

One CC dated 12/7/06 was analyzed on instrument MSV7 and one CC dated 12/16/06 was analyzed on instrument MSV6 in support of the volatile sample analyses reported in the data submissions. The percent difference (%D) between the average RRF's and the CC RF's for the CC dated 12/7/06 and 12/16/06 were within the acceptance criteria for all target compounds. The CC RRF's for the CC's dated 12/7/06 and 12/16/06 were within the acceptance criteria specified in the method for all target compounds with the exception of Acetone. The Acetone results were previously qualified under the Section 3A titled "Initial Calibration" therefore no further action was warranted.

#### 4. BLANKS

Two laboratory volatile method blanks, a storage blank, and two Trip Blanks were analyzed with this SDG. The results are summarized below.

#### MB436374

The following compounds were detected in the method blank analyzed on 12/7/06 (0927):

| Compound               | Concentration |
|------------------------|---------------|
| Acetone                | 1.6 ppb       |
| Total Xylenes          | 0.019 ppb     |
| 1,3-Dichlorobenzene    | 0.012 ppb     |
| 1,2-Dichlorobenzene    | 0.071 ppb     |
| 1,2,4-Trichlorobenzene | 0.033 ppb     |

# MB439131

There were no target analytes detected in method blank MB439131 analyzed on 12/16/06.

# Storage Blank (VHBLK)

The following compounds were detected in the in the Storage Blank analyzed on 12/7/06.

| Compound            | Concentration |
|---------------------|---------------|
| 1,2-Dichlorobenzene | 0.064 ppb     |
| Acetone             | 1.1 ppb       |
| Methylene chloride  | 0.074 ppb     |
| Total Xylenes       | 0.010 ppb     |

# Trip Blank

The following compounds were detected in the Trip Blank associated with the sample received on 12/6/06.

| Compound            | <u>Concentration</u> |
|---------------------|----------------------|
| 1,2-Dichlorobenzene | 0.017 ppb            |
| Ethylbenzene        | 0.021 ppb            |
| Methylene chloride  | 0.97 ppb             |
| Styrene             | 0.032 ppb            |
| Total Xylenes       | 0.012 ppb            |

The Methylene chloride, 1,2-Dichlorobenzene, and Total Xylenes detected in the Trip Blank were mitigated by the presence of Methylene chloride, 1,2-Dichlorobenzene, and Total Xylenes in the associated storage blank.

# Trip Blank

114885

The following compounds were detected in the Trip Blank associated with the sample received on 12/8/06.

| Compound   | Concentration |
|------------|---------------|
| 2-Butanone | 4.6 ppb       |
| 2-Hexanone | 0.70 ppb      |
| Chloroform | 0.049 ppb     |

The results are acceptable with the validator-added qualifiers.

# DATA VALIDATION SUMMARY - SAMPLE DELIVERY GROUP 206120608 PESTICIDES

Nij INGO

12200

Validation of the Gas Chromatography (GC) pesticides data, as prepared by Gulf Coast Analytical Laboratories (GCAL) for the samples collected from the Skinner Landfill site in December 2006, was conducted by Earth Tech using the National Functional Guidelines for Organic Data Review, (US EPA, October, 1999), as appropriate. The results were reported by GCAL under SDG 206120608.

| GCAL#       | Sample Description |
|-------------|--------------------|
| 20612060801 | SKGW60-1020        |
| 20612060802 | SKGW63-1020        |
| 20612060803 | SKGW64-1020        |
| 20612060810 | SKGW61-1020        |
| 20612060811 | SKGW61-1020 DUP    |
| 20612060815 | SKGW60-1020 (RE)   |
| 20612060816 | SKGW63-1020 (RE)   |
| 20612060817 | SKGW64-1020 (RE)   |

#### INTRODUCTION

Analyses were performed according to CLP-Organic Analysis Multi-Media, Multi-Concentration OLM04.2 SOW. Results of the sample analyses are reported by the laboratory as either qualified or unqualified. Unqualified results mean that the reported values may be used without reservation. Various qualifier codes are used by the laboratory to denote specific information regarding the analytical results.

The data validation process is intended to evaluate the data on a technical basis. The data package also was subjected to an internal laboratory quality review prior to submission to Earth Tech for data validation.

During the validation process, laboratory-qualified and unqualified data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data user. Final results are therefore, either qualified or unqualified. Validator-qualified results are annotated with the following codes in accordance with the Functional Guidelines:

- U The constituent was analyzed for, but was not detected above the level of the associated analytical reporting limit. The associated value is either the sample quantitation limit or the sample detection limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Details of the pesticide data validation findings and conclusions are provided in the following sections of this report:

- 1. Holding Times
- 2. Gas Chromatograph/Electronic Capture Detector (GC/ECD) Instrument Performance Check
- 3. IC

No lawer

" Hand

- 4. Calibration Verification
- 5. Blanks
- 6. Surrogate Spikes
- 7. Matrix Spike/Matrix Spike Duplicate (MS/MSD)
- 8. Pesticide Cleanup Checks
- 9. Target Compound Identification
- 10. Constituent Quantitation and Reported Detection Limits
- 11. Documentation
- 12. Overall Assessment

#### 1. HOLDING TIMES

The cooler temperature upon receipt at the laboratory was within the recommended temperature of 4°C +/- 2°C. All samples were extracted within the seven-day technical holding time and the five-day Validated Time of Sample Receipt (VTSR) method holding time.

## 2. GC/ECD INSTRUMENT PERFORMANCE CHECK

The Performance Evaluation Mixture (PEM) was analyzed at the correct frequency. Absolute retention times were within limits. The percent resolution between adjacent peaks was within QC limits for the Pesticide Analyte Resolution Check. The percent resolution between adjacent peaks is within QC limits for the Performance Evaluation Mixtures (PEM).

The percent breakdown for both 4,4'-DDT and Endrin in each PEM was less than 20.0% for both GC columns. The combined percent breakdown for 4,4'-DDT and Endrin in each PEM was less than 30.0% for both GC columns.

#### 3. INITIAL CALIBRATION

180.

IL INDIAN

4 ....

Individual standard mixtures A and B were analyzed at the correct frequencies and concentrations. The percent resolution criterion for Individual standard mixtures A and B were within the acceptance criteria.

The Percent Relative Standard Deviation (%RSD) of the calibration factors for each of the single component pesticides was less than 20%. The multi-component target compounds were analyzed separately on both columns at a single concentration level. Retention times were determined from a minimum of three peaks.

#### 4. CALIBRATION VERIFICATION

Absolute retention times were within appropriate time retention windows. The percent difference for each of the pesticides and surrogates in the PEM's were within the acceptance criteria of  $\pm 25.0$  percent for the calibration verifications.

#### 5. BLANKS

Two laboratory method blanks were analyzed with this SDG. The results are summarized below.

#### Method Blank 436322

No constituents were reported by GCAL for the method blank extracted on 12/7/06.

#### Method Blank 437681

No constituents were reported by GCAL for the method blank extracted on 12/12/06.

#### 6. SURROGATE SPIKES

Decachlorobiphenyl (DCB) and tetrachloro-m-xylene (TCX) surrogate spike recoveries were within the acceptance criteria (30% - 150%) with the exception of the following:

| Sample ID   | <u>TCX</u> | <u>DCB</u> |
|-------------|------------|------------|
| SKGW60-1020 | 29%        | 20%        |
| SKGW63-1020 | 40%        | 26%        |
| SKGW64-1020 | 43%        | 28%        |

<sup>5</sup> 11558<sup>2</sup>

Miragorit

As per the National Functional Guidelines, if recovery of either surrogate is between 10 and 30 percent then qualify detected results with "J" and non-detected results with "UJ".

#### 7. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Although no sample was submitted for MS/MSD analysis with SDG 206120608, sample SK-SW50-1020 was extracted for MS/MSD analysis with the same batch as the samples for SDG 206120608. All of the percent recoveries associated with the MS/MSD were within the acceptance criteria with the exception of the following: Lindane associated with the MS/MSD for sample SK-SW50-1020. All of the RPD's between the MS/MSD were within the acceptance criteria except for Lindane associated with sample for sample SK-SW50-1020. As per the National Functional Guidelines, no action is taken on MS/MSD data alone.

#### 8. PESTICIDE CLEANUP CHECKS

Recoveries of all pesticides and surrogates were within 80-120% for the lot of Florisil cartridges utilized for pesticide cleanup.

#### 9. TARGET COMPOUND IDENTIFICATION

All reported pesticide data were correctly identified with supporting chromatograms present in the data package.

# 10. CONSTITUENT QUANTITATION AND REPORTED DETECTION LIMITS

Constituent quantitations were correctly calculated and reported.

### 11. DOCUMENTATION

The documentation submitted for review appeared accurate and in order.

# 12. OVERALL ASSESSMENT

The results are acceptable as qualified by the data validator.

# CASE NARRATIVE

Client: Earth Tech Report: 206120608

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the sample cross-reference page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

#### SEMI-VOLATILES MASS CHROMATOGRAPHY

In the OLM04.2 - CLP Semi-Volatiles analysis, the 435994 MB was contaminated with bis-2-ethylhexyl phthalate. Samples were re-extracted outside holding time and reanalyzed as samples 20612060815 (SKGW60-1020 (RE)), 20612060816 (SKGW63-1020 (RE)) and 20612060817 (SKGW64-1020 (RE)).

In the OLM04.2 - CLP Semi-Volatiles analysis, sample 20612060801 (SKGW60-1020) had interference with the internal standard. Sample was re-extracted and re-analyzed outside holding time. All data is included.

In the OLM04.2 - CLP Semi-Volatiles analysis, sample 20612060801 (SKGW60-1020) had two surrogates outside of control limits in the acid fraction. Sample 20612060801 (SKGW60-1020) had one surrogate recovery outside control limits in the base-neutral fraction. All other surrogate recoveries were acceptable for this sample.

# **SEMI-VOLATILES GAS CHROMATOGRAPHY**

In the OLM04.2 - CLP Pest/PCB analysis, samples 20612060801 (SKGW60-1020), 20612060802 (SKGW63-1020) and 20612060803 (SKGW64-1020) exhibited low surrogate recoveries in the primary analysis. These samples were re-extracted and analyzed with a similar surrogate recovery. This is attributed to matrix interference.

#### **METALS**

\* 120

In the ILM04.1 - CLP Metals analysis, the MS recovery is not applicable for Iron for prepbatch 339041 because the sample concentration is greater than four times the spike concentration.

In the ILM04.1 CLP Cyanide analysis the Sample/Duplicate RPD for Cyanide and Total for prep batch 338465 is not applicable because the sample and/or duplicate concentration is less than five times the reporting limit.

In the ILM04.1 - CLP Metals analysis the Sample/Duplicate RPD for Silver for prep batch 339041 is not applicable because the sample and/or duplicate concentration are less than five times the reporting limit.

In the ILM04.1 - CLP Metals analysis, Aluminum, Barium, Chromium, Lead and Potassium are flagged as estimated for samples associated with prep batch 338214 due to the fact that the percent difference between the original sample result and the serial dilution result is greater than 10. A chemical or physical interference is suspected.

Hit HERALD

# Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

## Common Abbreviations Utilized in this Report

ND Indicates the result was Not Detected at the specified RDL

DO Indicates the result was Diluted Out

MI Indicates the result was subject to Matrix Interference
TNTC Indicates the result was Too Numerous To Count

SUBC Indicates the analysis was Sub-Contracted

FLD Indicates the analysis was performed in the Field

PQL Practical Quantitation Limit
MDL Method Detection Limit
RDL Reporting Detection Limit

00:00 Reported as a time equivalent to 12:00 AM

# Reporting Flags Utilized in this Report

J Indicates an estimated value

U Indicates the compound was analyzed for but not detected

B (ORGANICS) Indicates the analyte was detected in the associated Method Blank

B (INORGANICS) Indicates the result is between the RDL and MDL

Sample receipt at GCAL is documented through the attached chain of custody.
